Florid cemento-osseous dysplasia

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Florid cemento-osseous dysplasia](#). ORPHA:83451

Florid cemento-osseous dysplasia (FCOD) is a rare fibro-osseous lesion in the jaw that predominantly affects middle-aged women of African descent. It is generally asymptomatic or may manifest with pain and gingival swelling. Radiologically, it is characterized by multiple dense lobulated bone lesions, often symmetrically located in various regions of the jaw.
