Potential competing interests: No potential competing interests to declare.

The work is written in a very clear and detailed manner and is of very good quality. It raises several issues that, if not now, will undoubtedly become significant in the future. Despite the comprehensive and detailed writing style of the work, I can mention a few small and not-so-significant considerations.

1) Since the paper doesn't contain any new discoveries, in my opinion it should be published in the review section rather than as a short communication.

2) It would be desirable to add a small section about the mechanisms of virus penetration/evasion and stability, which will be presented from a non-immunological point of view.
