Potential competing interests: No potential competing interests to declare.

In general:

The presentation and use of language of the article is adequate. However, when the article is evaluated in terms of its content and contribution to the field, it is thought that it does not make a significant contribution.

1) The purpose and scope of the article are not fully clear. The problem is that it is not clear what the approach to solving the problem is and what is recommended in this article. No conclusion is included.

2) Although most of the information presented does not belong to the author, no reference is given. The references used are extremely limited. 2) Almost the entire article is taken from previously published reports. The information received from these reports was not discussed and interpreted in the manner and detail required.

In particular:

1) There is no reference to Figures and Tables in the text.

2) Figure 5.3 and Table 5.1 are not interpreted correctly. It has been written that soils are in the 3rd place, although they should be in the 2nd place in terms of greenhouse gas emissions. If not, it should be explained in more detail.

In conclusion:

It has been recommended that the this article is not suitable for publication in its current form.
