Potential competing interests: No potential competing interests to declare.

It is recommended to include a description of the study population selection in the Health Centers, including which services they were selected from and whether the sampling was random, systematic, or by convenience. This is to explain the sex distribution of the sample: 22.9% men and 77.1% women.

It is recommended to present the adapted DRS questionnaire, that is, the questions included in the DRS questionnaire with the three additional questions.

It is recommended to include how you selected the three additional questions. What methodology did you use? By reclassification? How did you assign the weights to these questions?
