Manuscript: "The Choice of Breeding Objectives and Selection Criteria Decided by Breeders of Various Goat Breeds and Factors Influencing Them"

The article deals with an extremely interesting topic that is often neglected by breeders, since producer preference is usually not considered as part of a comprehensive breeding scheme, which leads to the failure of these programs in the short term.

In general, the paper is adequately structured, and the methodology developed is satisfactory; however, the most serious problem of the manuscript has to do with the way figures and tables are presented. In general, it is complicated to read or interpret. It is suggested to the authors that they adjust and/or rearrange the way in which they present the tables and figures, and, as far as possible, summarize and/or join those that allow it.

In general, the document can be published with minor corrections, which the authors should consider.

Some of the suggestions made are:

The title is too long; it is suggested to summarize it.

Do not use repeated words in the keywords in the title.

Review the language and general wording of the document. Paragraphs that do not make sense are observed; for example, in the abstract, "growth rate (80%) and body morphology selection criterion (76%) then fertility....", correct throughout the document.

Proofread and correct punctuation and grammatical errors throughout the text. Page 2 "...found in the region. Though,..."
