# 4-Peptide Melanoma Vaccine

National Cancer Institute

## Source

National Cancer Institute. *4-Peptide Melanoma Vaccine*. NCI Thesaurus. Code C91722.

An emulsion of 4 melanoma peptides with potential immunomodulating and antineoplastic activities. Upon vaccination, 4-peptide melanoma vaccine may stimulate an immune response against 4 different melanoma associated antigens. This may lead to a reduction in tumor cell proliferation of cancer cells expressing these antigens.
