Review of: "Higher-Order Meta Distribution Analysis of Wireless Systems with Application to the Reliability of UWB THz Networks"

Dragana Krstic¹

1. University of Nis, Serbia

I haven't really had the opportunity to encounter this topic until now. After reading the work, I can notice that the authors have given a precise mathematical analysis for a defined scenario of wireless systems and an application to the UWB THz networks in this paper.

The topic is quite new, and it is evident that there are not many papers by other authors in the available literature. That is why there are a lot of self-citations, which is then understandable.

I have a few suggestions for technical improvements:

All abbreviations should be defined when they appear in the text for the first time, even if they are well known (3GPP, UAV, D2D, ...),

Do not end the section with a figure! Place figures at the top or bottom of the page, as close as possible to the text describing them! It will be easier for readers to follow.

Please put all formulas in separate rows, and for all those that are not yours derived here, cite sources from the literature! For those that have been derived here, please give more details (don't skip steps) because of the new topic.
