Potential competing interests: No potential competing interests to declare.

Overall paper content is well defined with respect to Key management problems that may occurs in cloud environment. The definition of the Key Escrow and other relevant information is good. The main requirement and expectation from my side is that Comparison is required especially with other existing review journals and any implementation work comparison with respect to key escrow problem. With the usage of encryption, the key management process, which is related to the creation, usage, and storage of the encryption keys had been raised.Several comparison table can be made and mention with different key size, process time, execution time, storage space etc., in order to show the journal to be more competitive and practical.
