Potential competing interests: No potential competing interests to declare.

I read with great interest the Manuscript titled " Targeting Cancer Cell Signaling Using Precision Oncology Towards a Holistic Approach to Cancer Therapeutics", topic interesting enough to attract readers' attention.

Although the manuscript can be considered already of good quality, I would suggest following recommendations:

- I suggest a round of language revision, in order to correct few typos and improve readability.
- In the era of precision medicine and the targeted cancer cell signaling therapies in oncological patients, It would be interesting to evaluate and cite current evidence about molecular insights and target therapy in gynecological cancers, in particular for endometrial and ovarian cancer. I would be glad if the authors discuss this important point, referring to PMID: 36833105 and 37314974.

Because of these reasons, the article should be revised and completed. Considering all these points, I think it could be of interest to the readers and, in my opinion, it deserves the priority to be published after minor revisions.
