**Potential competing interests:** No potential competing interests to declare.

This article provides valuable insights into perianal problems during the puerperium period and highlights the importance of understanding risk factors. The introduction effectively outlines the physiological changes during pregnancy and the puerperium, emphasizing the impact on perianal health. The study's methodology is well-detailed, including the study area, population, and data collection procedures.

The results section presents a clear overview of socio-demographic and clinical characteristics, along with the prevalence of perianal problems. The discussion further delves into the findings, comparing them with existing studies and identifying significant risk factors, such as increased parity, past history of perianal problems, and constipation during pregnancy.

However, a couple of recommendations for improvement:

1. The discussion section could benefit from a more concise summary of key findings and their implications.
2. Consider adding a brief limitation section to acknowledge any potential constraints in the study.

Overall, the article effectively contributes to the understanding of perianal problems during the puerperium period and provides a foundation for future research and interventions.
