It is a very good and complete review. Well written.

However, there are two things that I suggest changing. First, eliminate the actinomycosis section because it is not part of mycetoma. This is an endogenous infection caused by anaerobic bacteria, different from the aerobic actinomycetales that enter by implantation.

The second thing is to eliminate Nocardiosis because it is different from actinomycetoma due to Nocardia; the first disease forms grains, the second does not, and it is opportunistic.
