Dear Editor,

Thank you so much for choosing me as a reviewer of the article: **Excessive Aluminum in Soil: Review Paper.**"

1. The article lacks clear organization. The structure of the manuscript should follow a general role, title, abstract, keywords, introduction, methodology, results and discussion, conclusion, references.
2. The abstract is too general and does not contain a clear objective of the work. The key findings and contributions of the review should be stated.
3. The methodology section is missed. The searched databases and keywords should be, and the number of books, articles, and other information should be included.
4. Key words It is not recommended to use as keywords the words and phrases used in the title of the manuscript.
5. This manuscript is too general, and much information is repeated. The latest articles and information should be included.
6. All figures should be cited and described/discussed in the manuscript. However, all figures should be clear for the reader without referring to the text of the manuscript. The source of the figures should be given.
7. Clear, constructive conclusions should be given.
8. The references should be prepared according to one scheme. The full data for each reference should be given. Some of the citations are missed. More recent papers should be included.

I recommend major revision.
