Potential competing interests: No potential competing interests to declare.

1. I think that the first sentence, "The study of epidemic spread has generally relied on the description of a certain number of cases of an infectious disease like COVID-19 in relation to the time of occurrence of disease manifestations, rather than to the exact place of occurrence," may be confusing. As we know, the spread of infectious diseases is not only related to time, but also to space. I advise the author to see the reaction-diffusion epidemic model.
2. It is recommended to carefully check the format of the references.
3. After reading through the whole article, I seem to have failed to find the central theme of the article. Please add what the purpose of this research is.
4. This is a review article, and I think the methods and conclusions used by others should be briefly introduced in the review process.
5. I don't seem to find the conclusion of this article either. Please add the conclusion of the article.
