Potential competing interests: No potential competing interests to declare.

■ A nicely researched topic taking into account notes:

1. Determine the age range of the participating children so you can determine whether perceptions differ by age. More information should be provided about the demographics of the participants as this may affect how they see things.
2. The author indicated that the survey was relied upon, which was analyzed quantitatively, while the analysis of the cognitive maps was qualitative, so see this paragraph.
3. Reorganizing the presentation of results more clearly, as well as the possibility of adding statistical analyses to determine the frequency of some variables.
4. References, do not cite old references (before 2018).

I recommend publishing the study with minor modifications
