# NGFR wt Allele

National Cancer Institute

## Source

National Cancer Institute. *NGFR wt Allele*. NCI Thesaurus. Code C51552.

Human NGFR wild-type allele is located within 17q21-q22 and is approximately 20 kb in length. This allele, which encodes tumor necrosis factor receptor superfamily member 16 protein, plays a role in several biological process through signal transduction. The allele is involved in neuronal growth and apoptosis through nuclear factor kappa-B modulation.
