Definition

Defined by Giorgio Bedogni et al.

Qeios is a totally new integrated system of research production and quality check.

Researchers connected on Qeios compose their [Articles](#) along with a new object, the [Definition](#), directly on the platform. The [Definition](#) is a new piece of knowledge which represents one of the building blocks at the base of research.

With Qeios democracy is the new standard. A 100% acceptance rate for [Articles](#) and [Definitions](#) becomes essential to allow the entire researchers' community performing the most valuable quality check.

For the first time, a ranking of [Definitions](#) is built which determines what the best building blocks to be used in new research are.

Researchers have now the power to produce and share new research of increased quality and comparability, greatly reducing the risk of inconclusiveness and thus fuelling the entire virtuous circle.

Not only Qeios assists researchers in producing the best possible knowledge, it also helps them find new collaborations, funds and visibility, which is extended to anyone thanks to [Definitions](#).

Connection between researchers has never been so powerful.
