I appreciate to read this paper and I congratulate the authors.

Since "The aim of this study was to assess the relationship between dietary patterns and nutritional status among children aged ten years and below in the Buea

Health District", I suggested that in the abstract and the paper's body, the authors present mainly results linked with this objective. Associated factors other than dietary patterns, should be treated in analysis as potential confusion factors for the ajustment of the final models. If no dietary patterns is associated with nutritional status like I see in results, you can just say it.

Considering this result and according to the title, you can replace the objective by "assess dietary patterns and nutritional status among children aged ten years and below in the BueaHealth District" OR (and I recommand) "assess the relationship between socio-economic factors, dietary patterns and nutritional status among children aged ten years and below in the BueaHealth District". Then the title could become "Socioeconomic determinants, dietary patterns and nutritional status of children in the BueaHealth District".
