Potential competing interests: No potential competing interests to declare.

This paper is a report on a project conducted on renewable energy systems. The paper failed to cover very important aspects which should exist in a research paper.

First, there is no introduction telling the reader what the project is about. Second, no review of relevant literature in relation to the project in study. Third, the authors did not tell us what specific problem the hydro-solar generation system aims to solve for the reviewer to determine its novelty.

The methodology on the survey and development of the hydro-solar generation system is not detailed. Parameters such as turbine power, blade length and angle of attack etc. are not provided to enable the reader properly understand the design of the system. The implications from the impacts in the results are generic and do not give us a detailed breakdown of how beneficial the system is to the community.

Finally, no concluding part to summarize and possibly make recommendations for scientific purposes exist in this paper.

My recommendation is that this paper be rejected, and the authors be encouraged to present a proper manuscript with detailed report and data on the project they conducted.
