**Potential competing interests:** No potential competing interests to declare.

The topic is relevant, as the perception of safety in Educational Institutions is of high concern, however the study method of just taking 30 sample from random colleges across India (without any selection criteria) and of random campuses weakens the study. If taking survey as a key tool for the study, there should be sufficient sample strength to support the study. Also the survey has to be correlated to the architectural/ built environment parameters so as to understand, whether cpted has a role in the study or not. No architectural layouts or plans of the campuses were studied or dealt with in the study.
