# Odontogenic Myxofibroma

National Cancer Institute

## Source

National Cancer Institute. *Odontogenic Myxofibroma*. NCI Thesaurus. Code C7452.

An intraosseous odontogenic neoplasm with good prognosis, arising from the mandible and less frequently from the maxilla. It is characterized by the presence of stellate cells, myxoid stroma formation, and prominent collagen. Small tumors may be cured with enucleation. Complete excision may be required for larger tumors.
