The manuscript provides interesting dynamics about risk factors involved in compromising reproductive performance of the local farms. The incidence of the various reproductive disorders provides valuable information to better manage the herds. In my opinion, the author should provide the detailed questionnaire as a part of the manuscript. The data analysis is too simple to obtain any generalized conclusions. Authors should include the risk factors in a multivariate analysis to determine the impact of reproductive efficiency (pregnancy) if the sample size is not a limitation. Overall, the study is well planned and written.
