Bozitinib

National Cancer Institute

Source

National Cancer Institute. *Bozitinib*. NCI Thesaurus. Code C129717.

An orally bioavailable inhibitor of the proto-oncogene c-Met (hepatocyte growth factor receptor; HGFR) with potential antineoplastic activity. Upon administration, bozitinib selectively binds to c-Met, thereby inhibiting c-Met phosphorylation and disrupting c-Met signal transduction pathways. This may induce cell death in tumor cells overexpressing or expressing constitutively activated c-Met protein. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis.
