

Review of: "Radiological parameters after LLIF for adjacent-level disease treatment"

Yoshinori Kyoh

Potential competing interests: No potential competing interests to declare.

1. The surgeon needs to specify whether this surgery was solely LLIF or if posterior fixation was also performed.

Additionally, if posterior fixation was performed, it should be clarified whether this was percutaneous screw fixation or open screw fixation requiring exposure.

2. Languages other than English are used within the figures and tables. Additionally, there is a reversal of the word order as it appears in the main text and when it appears in the figures/tables.

3. The same paragraph appears twice in succession in the main text.

4. X-ray imaging of the cases should be presented.

5. An explanation regarding "Lumbar mismatch" should also be provided.

6. In general, this paper somewhat lacks originality and although interesting, the content and discussion sections are lacking in depth.
