The structure of the article is highly descriptive, but it lacks truly novel results. While the classification presented is indeed original, I would recommend that, in order for it to be considered for publication, the authors enhance the classification with higher-quality visual diagrams than those presented in Figure 1. Ideally, anatomical dissections should also be included to provide further clarity. I also recommend that the authors consult the article by Wen et al., "Microsurgical anatomy of the temporal lobe: part 1: mesial temporal lobe anatomy and its vascular relationships as applied to amygdalohippocampectomy," for additional insights.
