

# Review of: "On Probabilities in Quantum Mechanics"

Abdulbast A. Abushgra

Potential competing interests: No potential competing interests to declare.

I would say that this article is an argument about theories of quantum computing, and I agree with the author on some of these thoughts. There is no comment on this article as long as the article derives from thoughts that are able to be right or wrong. I think these arguments in the field of quantum computing are healthy.

The only comment on this article, and I hope the author considers it, is about calling the third party Alice. This, as a cryptographer, would cause some confusion. So, scientists and cryptographers consider Eve a third party, but Alice and Bob are the legitimate communicators.
