

Review of: "Time evolution and convergence of simple migration models"

Simone Olivetti

Potential competing interests: No potential competing interests to declare.

Overall this article seems interesting. However, I found inconsistencies in the analysis of the model. First of all, if you talk about boundary conditions, in the model equations differential terms should be explicit, e.g. spatial gradient and non-stationary terms (time derivative). Then you talk about periodic boundary conditions when you just presented steady state equations!. To my opinion, before attempting any publication the model should be treated in terms of partial differential equations (PDEs) so their solutions can be described more clearly.
