Atrioventricular Reentrant Tachycardia by ECG Finding

National Cancer Institute

Source

National Cancer Institute. *Atrioventricular Reentrant Tachycardia by ECG Finding*. NCI Thesaurus. Code C62261.

An electrocardiographic finding of a regular supraventricular tachycardia which utilizes an atrioventricular bypass tract as its retrograde limb (orthodromic tachycardia) or as its antegrade limb (antidromic tachycardia). QRS complexes during sinus rhythm may show preexcitation. During orthodromic tachycardia the preexcitation is not present and a retrograde P wave may appear after the QRS complex. During antidromic tachycardia the QRS complex is preexcited. (CDISC)
