**Potential competing interests:** No potential competing interests to declare.

The following are my observations about the article:

1. The instrument the researcher(s) used in measuring the pre-service teachers' achievement in mathematics is completely absent the methodology section, the instrument should be described along side motivation instrument.
2. The presentation of result is faulty. The candidate(s) should check the person table again and present the result appropriately. Any variable correlating itself will give you 1 and not the other way round as presented in the table.
3. The statement of the problem is scanty and need to be revisited. The problem should bother on the achievement of pre service teachers and not the students.
4. Accept manuscript with major corrections
