Renomedullary Interstitial Cell Tumor

National Cancer Institute

Source

National Cancer Institute. *Renomedullary Interstitial Cell Tumor*. NCI Thesaurus. Code C5100.

A benign, asymptomatic kidney tumor arising from renomedullary interstitial cells. It is often found incidentally at the time of nephrectomy in adults. These tumors are either single or multiple and usually measure 1-10 mm in diameter. Microscopically the tumor cells are small, stellate, or spindle cells, embedded in a faintly basophilic stroma reminiscent of renal medullary stroma. (WHO 2016)
