Potential competing interests: No potential competing interests to declare.

the topic of the paper is indeed interesting. This is especially in light of today's world of AI and chatgpt. Additionally, institutes of higher education are moving away from 'controlled environment' exams to assignment based assessments. Majority of these assignments would indeed require students to do some research.

The paper, however, lacked empirical data. It had a reasonably good discussion of issues. Maybe, a survey of attitudes towards cheating would have been helpful. it would also be interesting to see differences of attitude between different generations and different disciplines.

The ethics of cheating is probably linked to society ethical standards and the level of corruption. Another factor is the emphasis on grades.

the paper has raised a number of issues that could be further researched.
