It is an interesting study that discusses individual perceptions of spiciness. I learned a lot from the findings. The following are my comments.

[1] As you said, the sample size was relatively small. It may be more reliable if you can add more participants.

[2] You aimed for a diverse participant pool in terms of age, gender, and cultural background, as these factors can influence sensory perception. There may need a picture or table to show demographic characteristics.

[3] Figures in the Result part seem too many. I suggest you to combine them as a picture.
