The article is intended to evaluate the ability of a BPFC platelet-rich plasma preparation (Bioplasma®) to favor the healing process of patients affected by BRONJ. However, some important points must be reviewed by researchers: 1. What were the exclusion criteria for participation in the study? 2. Have the patients used any other type of therapy? 3. The study is not reliable enough for me. Information that 100% of people had an effective treatment effect. Maybe it would be worth supporting these results with some photos? On what basis was the therapy assessed as effective? For me there are too many questions about this issue. 4. What were the centrifugation conditions to obtain PRP plasma? 5. The literature is very outdated, it is worth updating it.
