**Potential competing interests:** No potential competing interests to declare.

The project is interesting and the final device looks promising. However, there research does not follow the F.A.I.R., initiative since it does not provide details of the implementation. There is no detailed information about the required coding, how to assemble the device or the followed parameters to collect the data from the costumers or tested and how did they ensure no biases during that process. Contextual images are too big and relevant images such as the workflow diagram is too compact so it can be challenging to read and comprehend. I hope the document is further extended providing data and details about the analyses performed.
