**Potential competing interests:** No potential competing interests to declare.

Neuropathy in patients with tuberculosis has been attributed to antituberculous treatment, but other possible mechanisms exist, such as secondary radiculopathy due to tuberculous meningitis, vasculitic neuropathy, and potential direct invasion of mycobacteria. Has your team investigated other possible factors? Have you conducted any imaging studies on the patient? If so, it would be useful to include the results in the article. Additionally, I recommend a more scientific title. Thank you for allowing me to review your article. It is very interesting.
