Potential competing interests: genetic and animal breeding

This article is very interesting but I have some specific comments and suggestions below.

1. The summary is not clear. Non-abbreviated words should be written in the abstract
2. In the introduction, you ought to keep the introduction brief, and write a reference at the end of each section.
3. To be a valuable research, the Heritability and Genetic Correlations must be estimated for each of the studied inbred Population so that we know which of these populations are better, and have the highest value compared the other population. That is for selecting the best Population with higher Heritability for Growth Traits, This can play a major positive and rapid role to improve and increase growth traits in this inbred Local Chicken in Nigerian.
4. This study must gives clarify the image of the genetic diversity of the Nigerian inbred Local Chicken in and the breeders can used it for mating system when need to make the crossing among these inbred Population.
