Potential competing interests: No potential competing interests to declare.

Abstract: The conclusion is vague and does not send a specific message.

Results: The repetition of results already shown in the table may not be necessary.

Discussion: A few typos were observed. Please recheck the interpretation of the results of logistic regression. The discussion should have been an examination of the factors identified as important following statistical analysis as well as a comparative review with the results of other studies. Please improve on it.

Conclusion: The recommendations are not drawn from the results of the study.

Limitations: The study focused on a specific town, limiting generalizability to broader contexts.

Other unexplored factors may also contribute to incomplete vaccination.

Overall, the subject matter is topical, and the authors have made a good attempt. However, the quality of writing can be greatly improved upon.
