Potential competing interests: No potential competing interests to declare.

The paper is informative, as a note, but does not provide clear objectives or methodological information about the places where the species grows. What were the methods to collect the data? What are the species of insects visiting the flowers?

Please check that the scientific names are correctly written.

It would be fine to increase the introduction; it is short and does not provide a complete scene of the problem to be studied in the paper.

The results of the paper are a morphological description of the plants but do not describe the ecology.
