Potential competing interests: No potential competing interests to declare.

The article is interesting and provides valuable information for local waste management and the reduction of soil erosion in the region studied.

Figure 4 can be improved; it has some writing errors, and some words are underlined in red.

It is suggested to complete the materials and methods. The information on the rainfall simulation should be completed with water intensity, time, water quality parameters, among others.

Check the tables; some data is in two rows, and columns have different widths.

The standard deviation should be included in the results.

The discussion has too many subtitles and becomes a bit repetitive. Furthermore, it needs to properly discuss the findings of other authors, not just mention some of them.

The conclusion is repetitive, and the most relevant results should be added.
