Potential competing interests: No potential competing interests to declare.

The document has few references (only 4), and many are old. New literature review work is needed to support the design of the robotic arm for additive manufacturing. The document looks like a cut from a patent document, as stated at the end, including the images that were used without the correct citation. My assessment is to reject the work, and as a suggestion, I recommend that the authors re-evaluate the work, focusing on topics involving the research: kinematic movement, additive layer stacking process, printing parameters, etc.
