The paper's composition is coherent and the structure is logical and supports the goal of the paper. The topic is very interesting. However, the following remarks could be considered before publishing the aforementioned paper. It is not clearly stated which is the reference year of all calculations/ evaluations, in any case a normalization should be considered if different cost's categories have different reference year. As a suggestion the reference year should be as close to present as possible, the use i.e. of Chemical Engineering Plant Cost Index methodology will facilitate towards that direction. Furthermore, it is not clear if the land use has been taken into account on the economic evaluation. In addition, a schematic presenting a simplified P&ID would definitely assist the quality of the paper.
