Potential competing interests: No potential competing interests to declare.

This article presents a commendable endeavor that requires remarkable resilience on the part of the researcher. Its objective is to bridge the gap that often exists between scientific and theological perspectives on a specific subject. In its pursuit, the article interlaces various strands of research and diverse viewpoints.

While the author personally subscribes to the idea that science and faith can coexist harmoniously, they delve into the intricate terrain of addressing phenomena that are primarily emotional rather than empirically tangible. Such inquiries pose a significant challenge within the scientific domain due to the inherently personal and emotional nature of faith. It is essential to note, however, that the article strives to emphasize the impact of faith on one's physical well-being. Nevertheless, it is important to acknowledge that the article's exploration of this theme leans towards abstraction, drawing upon a compilation of experiential narratives that, while informative and valuable, may not align with the stringent standards of empirical scientific validation.

In this context, the article provides valuable perspectives that encourage reflection and future exploration at the intersection of science and emotional experiences.
