The complete assessment is appropriate. According to my expertise and education, it requires additional improvements and the addition of certain things before publication.

This review paper lacks an adequate introduction and a literature review. There are several characteristics of copper nanoparticles that are missing. A thorough understanding of copper nanoparticles is necessary, encompassing their shape and size, their general mechanism of action, and so on.

This document merely provides an overview and does not go into detail. There are no previously reported data or results in the paper.

To offer a deeper look, additional sources for incorporating and rejection criteria are required. To boost the relevancy, a few examples of tables should be provided.

In summary, the current review is organized and instructive however the points listed above can improve its quality, impact, and lucidity.
