Here are some suggestions to improve the research article "The Use of Angiotensin-Converting Enzyme Inhibitors in Hospitalized Patients With COVID-19 Is Associated with a Lower Risk of Mortality:

- Investigate potential biological mechanisms through which ACEIs may reduce mortality in COVID-19 patients, possibly integrating biomarkers or laboratory data, such as inflammatory markers, cytokine levels, and ACE2 activity.

- If it is possible to investigate the role of clinical care pathways and treatment variations during hospitalization that may affect patient outcomes, ensuring a comprehensive assessment of the treatment environment.

- The study does not explicitly detail its limitations in the provided manuscript. However, several implicit limitations can be inferred based on the nature of the study and its findings.
