Review the article entitled: *Sustainable Agriculture: Aquaponic-Integrated Greenhouse Cultivation of Cantaloupe Melon with Drip Irrigation System*.

1. The title seems to be not relevant to the contents of the article. What is the concept of sustainable agriculture? The contents do not present the data of environmental and others in the text...It should be presented for validation.
2. It should be clear what the methodology is because the work only focuses on melon production variables.
3. The abstract is not well structured for a scientific paper.
4. The introduction is not analyzing why this study needs to be conducted. What are the aims or motivations of this study? What are the hypotheses that the study intends to demonstrate?
5. The methodology is not possible with the information presented to guarantee its replication by other researchers.
6. Results look like a case report of a project in which the contributions of the study are not clear and explaining. It lacks information to give scientific validity to its results.

In general, this manuscript cannot be accepted for publication. It needs to be modified and rewritten more clearly.
