The manuscript is interesting, coherent, and well-written. It offers interesting data on a current and important public health issue such as the possible association of periodontal disease with systemic diseases, and in this particular case, with complications during pregnancy. The results showed no association between periodontal disease and pre-eclampsia in the population studied. The authors argue that a possible justification for this fact is biases in the self-measurement of periodontal disease. However, it could also be very interesting that the non-association is, in fact, a non-association. And then discuss what might be the mechanisms underlying this possibility.

Otherwise, the article is interesting, and in my opinion, should be published.
