Dear Editor,

After reading and analyzing this paper entitled "Widespread emergence of OmpK36 loop 3 insertions among multidrug-resistant clones of *Klebsiella pneumoniae*", which aimed to characterize mutations in the extracellular loop 3 (L3) region of the OmpK36 porin of carbapenem-resistant *Klebsiella pneumoniae* strains, and to characterise their diversity and impact on resistance and virulence; I find that the Materials and Methods section is well developed and explains well the techniques used to achieve the objectives of this work.

the Results part is well presented and the results found are interesting; as well as the figures are clear and the legends very explanatory.

I find this article interesting and in favor of an acceptance.
