Pancreastatin

National Cancer Institute

Source

National Cancer Institute. *Pancreastatin*. NCI Thesaurus. Code C104100.

Pancreastatin (48 aa, ~5 kDa) is encoded by the human CHGA gene. This protein is released from the full length chromogranin-A protein by caspase cleavage and plays a role in the inhibition of the release of chromogranin-A, parathyroid hormone and somatostatin.
