The topic of the paper is very actual as it deals with a growing problem which is expected to increase its impacts on environment and humans.

However, I found the paper too short for a comprehensive review. Also the references are outdated lacking in recent studies recognizing the increasingly role and impacts of wildfires worldwide.

In addition, the paper doesn't have a global perspective, as it often cite data and statistics which are limited to US.

I think that the paper can be significantly improved by:

- using more global data and statistics, showing the actual (and increasing) impacts of climate on wildfires and viceversa;
- investigating more recent scientific literature on this topic;
- comparing recent data with ones of 20-30 years-old ones, clearly showing the acceleration of the phenomenon under investigation in the last decades.
