Potential competing interests: No potential competing interests to declare.

While I am not a specialist in this type of manuscript, the topic is of interest to academics involved in chemical engineering education.

I also believe that the text is well written and clear to readers.

As a recommendation, I suggest clarifying the abbreviations used throughout the text.

Also, if the authors could include some results of the simulations in UNISIM, that would be beneficial.

I also suggest clarifying what kind of facilities/computer equipment is needed and if they have any particularities.
