The study highlights important areas for improvement by offering insightful information about guidelines adherence and meropenem prescribing practices in a Pakistani tertiary care hospital. Understanding and addressing antibiotic stewardship concerns in a local setting is greatly aided by its thorough investigation of empirical prescribing practices and patient education. The areas listed below are recommended for enhancement:

1. Information on the parameters of the WHO sample size calculator should be included in the sample size calculation.
2. More statistical analysis is needed; there should be comparative analysis.
3. Methodology should be in a proper manner.
4. Discussion should be in accordance with antibiotics resistance guidelines.
5. Concisely stating the main conclusions and their clinical significance is how results should be summarised.
6. It was a good approach.
